

Executive E-Commerce & Revenue Dashboard

Technology Used: Power BI

Problem Statement

Raw transactional sales data can make it difficult for business users to quickly understand revenue, profitability, customer contribution, regional performance, delivery performance, and payment trends.

The objective of this project is to transform transactional sales data into an interactive business intelligence dashboard that provides a consolidated view of key business metrics.

Data Preparation

Superstore Sales or Olist Brazilian E-Commerce Dataset (available on Kaggle).

The dataset was imported into Power BI and prepared using Power Query.

The preparation process included reviewing:

- Data types
- Numerical fields
- Date fields
- Categorical fields
- Sales and profit values
- Delivery information
- Customer and order information

Data Analysis

DAX measures were developed to calculate important KPIs and support dynamic analysis.

The dashboard can be filtered using Region and Category slicers.

Dashboard Components:

KPI Section

- Total Revenue
- Total Profit

- Total Orders
- Average Delivery Days

Sales Trend

Analyzes sales performance over time and includes a forecast of future sales.

Customer Performance

Compares customer sales, profit, and order volume.

Category & Region

Compares category-level sales across different regions.

Delivery Performance

Analyzes average delivery days by state.

Customer Segment

Shows sales contribution from different customer segments.

Payment Mode

Analyzes sales distribution across different payment modes.

Expected Business Use

The dashboard can support business users in monitoring sales performance, understanding customer behavior, comparing regions and categories, and identifying areas requiring further analysis.
